

## AIDSinfo Drug Database App

The **latest** and **most comprehensive** HIV-drug mobile app database

### The Need

Through AIDSinfo website analysis and user research, ICF supported the National Library of Medicine (NLM) and the National Institutes of Health (NIH) to determine that health care providers and consumers need HIV-related drug information and are increasingly solely depending on mobile devices to access that information.

### The Solution

Together with AIDSinfo and the NIH, ICF helped develop the AIDSinfo Drug Database App to address the increased use of mobile devices to access health information. The app provides access to information on more than 100 HIV drugs in both English and Spanish and many features that make it highly useful for both health care professionals and public consumers. Two key features are that it automatically updates the included drug information, ensuring that users can always access the most up-to-date information without having to constantly download app updates, and that the app works offline (thus, allowing use in areas where an Internet connection is not possible).

Creating an app that integrates the right technology to address real biomedical information required ICF to leverage both our HIV subject matter experts and programmers. In addition to internal collaboration, external collaboration was vital. To ensure against duplicating efforts, ICF worked directly with a Health and Human Services (HHS) multiagency steering group to develop content to fill gaps in information, where there was no available data. The app combines content from multiple HHS agency data sources, drug labels from the Food and Drug Administration (FDA) and pill images from the National Institute of Allergy and Infectious Diseases at the NIH.

## The Benefit

More than just another informational tool, the AIDSinfo drug database app empowers users and gives them the ability to personalize their information and take control of their health care. The app lets users set pill reminders, create notes about each drug, and set bookmarks so they can easily view or share their drug information with their health care providers. Other interesting features include spoken (audio) drug name pronunciation guides and pill images.
